#### SNEP Watershed Implementation Grants Final Report Nantucket Conservation Foundation Windswept Bog Wetland Restoration

#### **0. Executive Summary – SEE ATTACHED.**

#### **1. Cover Information**

Date: October 8, 2024

Project Name Subaward Number: SWIG23-6-NAN-WIND Subaward Period: September 12, 2023 -December 31, 2025

Subrecipient Organization: Nantucket Conservation Foundation Report Contact Person, with telephone & email: Karen Beattie Vice President of Science & Stewardship 508-208-4147; kbeattie@nantucketconservation.org

Report Type: Final

#### 2. Project Report Narrative

Summarize the Project activities undertaken during the reporting period within the following headings, building upon the narrative from previous reports, if any.

#### 2.A. Project Results

#### **Project Summary:**

Windswept Bog is a former organic cranberry farm on the northeast end of Nantucket Island. The farm is privately owned by NCF, a non-profit dedicated to conservation and stewardship of Nantucket's open lands. The bogs are central to 231 acres of protected open space including freshwater wetlands, hardwood forests, and upland grasslands. The overall restoration project will restore 40 acres of former cranberry bog to self-sustaining natural wetlands and integrate the restored wetlands into the broader landscape and watershed. The project has been recognized by the Massachusetts Division of Ecological Restoration (DER) as a DER Priority Project; partners have been coordinating since 2019 to develop and permit the restoration design. SWIG23 funding contributed to implementation of Phase 1 of the restoration, which restored ~14 acres to diverse wetland habitats.

#### **Key Objectives:**

There are three high-level goals for the restoration of Windswept Bog: (1) successful ecological restoration, (2) long-term conservation, and (3) continued passive recreational access. To achieve these goals, the project design focuses on restoring hydrology to support self-sustaining wetlands within the site, eliminating barriers to fish and wildlife movement, addressing farm-related physical simplification to dramatically enhance habitat and expand resident (and transient) biota, and providing opportunities for scientific research, public education, and passive recreation.

The project's process-based restoration approach will ultimately repair the natural movement and storage of water as a driver for wetland recovery and re-establishment of self-sustaining wetlands. Work across all phases of the project will remove 3,500ft+ of berms and 28 water control structures to restore wetland hydrology and connectivity and establish a self-sustaining wetland system. Roughening 14 bog cells (6 cells in Phase 2 plus 8 completed in Phase 1) will break up mats of cranberry and underlying sand, expose native peat and seed bank, and create microtopography for diverse wetland habitat. Excavation to lower ground surface elevations will establish a range of habitats (semi-permanently to seasonally flooded wetlands). Collectively, 40 acres of retired cranberry bogs will be restored to wetland habitats, providing flood dampening and improved water quality immediately upstream of Polpis and Nantucket Harbors (which are both impaired for nitrogen and bacteria). The project will preserve refugia for inland species and eventual marsh migration, in turn, reducing exposure to sea level rise and storm damage.

The project will also demonstrate and refine design and construction approaches that can be applied to other retired bogs and resilience projects across the region focused on nature-based strategies for flood protection and adaptation in coastal systems. NCF's ongoing research program at the site will track both short-term and long-term restoration success and facilitate transfer of lessons learned from the project to the broader region.

#### Major Tasks:

#### **QAPP Development**

The QAPP was developed and submitted for RAE and USEPA approval. The QAPP for the project was fully approved on February 29, 2024.

#### **Ongoing Outreach/Education Prior to and During Construction**

NCF has completed meet-and-greets with neighbors prior to construction, as well as hosting one-on-one tours for interested neighbors of the site during construction to answer questions and describe the work that has occurred.

- The initial site visit with Nantucket Conservation Commission was completed prior to construction.
  - The 'user friendly' plan renderings have appeared in multiple venues, including:
    - Nantucket Today: The Winter Issue—this is a complementary local magazine available in print at local shops as well as online.
    - New England Public Radio story: "At a Nantucket cranberry bog, conservation group launches its biggest restoration project" (February 15, 2024)
    - The project sign installed at the trailhead parking area
    - The Nantucket Conservation Foundation's and Living Observatory's respective websites
- Other news media have also featured the project in response to a press release
- A complete list of media coverage is included below in Section 2F (with copies also

included as an attachment)

- A Partners and Funders Site Tour took place on March 5, 2024 with 18 project partners (including 1 representative from SNEP) and press from 3 media outlets (Inquirer & Mirror, Nantucket Current, Boston Globe).
- Boardwalks to reconnect passive recreation trails across newly restored areas were installed in March 2024.
- Capacity-building via NCF's participation as a partner in the Living Observatory learning community around cranberry bog restoration is underway—NCF participated in an event with Living Observatory in July 2023, members of the Living Observatory community participated in the Partners and Funders Tour and two project updates have been posted on the Living Observatory website (https://projects.livingobservatory.org/).
- NCF has been producing aerial images and drone photo/video of the project throughout construction and using this material for update posts, with plans to create a project documentary from the footage later on.
- NCF has also set up multiple time-lapse cameras to document post-restoration ecosystem development.
- Social media posts featuring the project have been published by all project partners including by NCF, MassDER, SumCo Eco-Contracting, and Fuss & O'Neill, as well as on local Nantucket news accounts.
- Interpretive signage is under development now and will hopefully be installed by spring 2025.
- NCF hosted monthly public tours of the restoration site beginning in April through September 2024 and will resume these tours in 2025 as soon as Phase 2 construction is completed.

#### **Contractor Selection**

Bid solicitation, review, and contractor selection took place between October 20, 2023 and December 4, 2023 via a competitive process that was documented in a memo titled "Bidding Process & Bid Evaluation Review and Comments: Windswept Bog Wetland Restoration" dated December 4, 2023 (previously provided to SNEP/RAE). The effective date of the construction contract established between NCF and SumCo Eco-Contracting is December 18, 2023.

#### Mobilization and implementation of Phase 1 of the Wetland Restoration – 100% Complete

Mobilization began in early January, 2024 and implementation of Phase 1 construction was complete by March 15. A final Phase 1 close-out walk was completed with the contractor on April 2, 2024.

#### On-site Monitoring and Construction Direction by Restoration Design Team

Fuss & O'Neill's wetland scientists and project designers as well as NCF staff were on site approximately weekly throughout construction to guide field decisions regarding the restoration, confirm that construction was proceeding in accordance with the project design, and provide oversight and administration of the construction contract.

#### Monitoring of Restoration Response & Adaptive Management to Prepare for Phase 2

Since construction of Phase 1 was completed in March 2024, NCF and project partners conducted post-restoration monitoring (described in detail in the approved QAPP), which included monitoring of: hydrology, soils, vegetation, photo monitoring points, etc.

Fuss & O'Neill staff have completed monthly monitoring visits to conduct visual field observations of surface flow patterns in restored areas and overall patterns of vegetation establishment. Water level loggers removed during active construction were reinstalled on April 1, 2024 and will continue to record continuous measurements of groundwater throughout the site. In September 2024, the team collected baseline soil profiles for the restored bog cell areas; as time progresses, this baseline information will allow the team to track development of hydric soils as an indicator of wetland hydrology.

NCF staff collected vegetation transect data in September 2024. Pre-restoration transects were re-established so that pre-restoration and post-restoration data can be compared to quantify change over time as a result of the restoration effort.

Finally, NCF has been collecting monthly photos at established photo-points. Photos are collected from the same vantage point and in the same cardinal direction each time so that the data can be qualitatively compared to observe and track change before, during, and after restoration.

#### 2.B. Next Steps & Recommendations

Phase 1 restoration areas were selected because they were representative of different site conditions and provided a good variety of restoration activities to observe post-restoration to gain additional information, which has now been incorporated into the design for Phase 2. Construction of Phase 2 is required to complete restoration of the remaining 6 bog cells, creating a continuous, dispersed flow path through the site and connecting the already-restored cells to the natural adjoining wetlands. Phase 2 is also necessary to achieve restoration of the full extent of proposed restoration—the second phase encompasses roughly 2/3 of the total wetland acreage to be restored on the site.

With Phase 1 restoration and post-restoration monitoring now complete, the project is ready for Phase 2. Construction is slated to begin again on November 1, 2024 and continue through March 15, 2025. Phase 2 implementation will restore the remaining 6 bog cells (~26 acres) in the central portion of the site, for a total of approximately 40 acres of restored wetlands across phases. Along with the wetland restoration, upland areas between the bog cells will also be restored and enhanced to facilitate expansion of sandplain grassland habitats and other community types. Phase 2 construction will mirror the work performed in Phase 1, including microtopography, excavation, and construction of boardwalks for public access, resulting in completion of the entirety of the planned restoration project.

Completion of Phase 2 will complete the full extent of the restoration design to achieve the desired ecological and community benefits of the project and set the entirety of the site on a trajectory toward redevelopment of self-sustaining natural wetlands. NCF's Ecological Research, Stewardship and Restoration Department will take over from there, engaging in ongoing monitoring and research after the site is restored to track how vegetation, turtles and other wildlife, and water quality respond to the restoration work over the long-term.

#### 2.C. Compliance

A Quality Assurance Project Plan (QAPP) for the post-Phase 1 monitoring effort was prepared for the project and was approved by EPA on February 29, 2024.

All project permits were issued prior to commencement of Phase 1 construction:

- MA Wetlands Protection Act Restoration Order of Conditions (SE48-3655), issued July 10, 2023
- U.S. Army Corps of Engineers Section 401 Verification Letter (NAE-2023-01812), issued December 20, 2023
- NHESP Habitat Management Plan (23-5199 (19-38610)), approved May 26, 2023
- NPDES Construction General Permit (MAR1004YX), Active as of December 29, 2023

#### 2.D. Project Partners

List major Project partners, and briefly note their contributions.

- Nantucket Conservation Foundation (NCF)
  - Karen Beattie VP of Science & Stewardship Project Lead providing grant management, ecological oversight, and liaison to NCF Staff and Board of Trustees
  - $\circ~$  Dr. Jen Karberg –Director of Research & Partnerships; oversight of ecological monitoring
  - Kelly Omand –Plant Research Ecologist/Botanist rare plant habitat; leading ongoing vegetation transect monitoring at randomly-located monitoring locations that were established pre-restoration
  - Danielle O'Dell -Wildlife Research Ecologist- rare wildlife habitat; input on turtle habitat needs, construction best practices
  - Nick Larrabee Director of Land Management former bog manager
  - Cormac Collier President and CEO fundraising; outreach
  - Neil Foley Interpretive Education Coordinator/Ecologist
- MADER Jessica Cohn Cranberry Bog Program/Ecological Restoration Specialist -technical assistance/financial support
- Fuss & O'Neill -Michael Soares and Dr. Julianne Busa– restoration design leads; wetland scientists; technical and design oversight during construction
- NHESP oversight of Habitat Management Plan
- SumCo Eco-Contracting (Travis Sumner) -- Contractor implementation of restoration design

#### 2.E. Volunteer and Community Involvement

No volunteer time was proposed as match and volunteer hours have not been contributed during the reporting period. From a public safety perspective, it was decided that having volunteers on site during construction would not be prudent.

#### 2.F. Outreach & Communications

The project has received extensive media attention, including from the Boston Globe, which printed a front page story with pictures of the site immediately post-restoration in mid-March. Links to a number of these media stories are provided below. Please see above for the full outline of active outreach, engagement, and communications activities that NCF has conducted over the course of the project.

#### Summary Budget Table 2: Expenditures by Project Task (Grant Funds Only)

#### 3.B. Budget Narrative

The approved SNEP Grant budget includes two line items under contracts:

- QAPP Subcontract expenses in the amount of \$5,000
- Phase 1 Construction Contractual expenses in the amount of \$250,000

Over the course of the project, we submitted invoices showing:

- QAPP Development
  - \$5,000 for QAPP development by Fuss & O'Neill, completed at 100% as reflected in progress updates above (F&O invoices dated March 19, 2024 and February 7, 2024).
- Mobilization and Implementation of Phase 1 Construction
  - \$100,000 toward SumCo Eco-Contracting construction contract (Pay Requisition #2)
  - \$150,000 toward SumCo Eco-Contracting construction contract (Pay Requisition #3)

NCF is also reporting cash and in-kind match. Cash was put towards the remainder of Pay Requisition #2 and #3, using DER grant funds.

In-kind services were provided by NCF staff for monitoring, construction contract management and oversight, and outreach according to the following breakdown:

a. Personnel (Grantee Org. Only)		In-kind match
Karen Beattie, NCF VP Science &		
Stewardship	15 wks @ 25 hrs/wk @ \$72.00	\$27,000

Total Fringe		\$12,743

#### 4. Supporting Materials

Include high-resolution digital images of supporting materials related to the Project, including:

- Project maps and drawings;
- Project photographs, including photos depicting implementation sites before,

during, and after implementation; photos of Project signs, etc.;

• Press releases, news articles, brochures, educational curricula, etc.

Where file sizes allow, include all supporting materials in the same, single PDF document as the progress report. In the event that file sizes for supporting materials are too large to include in a single PDF of the report, contact RAE to set up a shared cloud file.

A copy of the approved project QAPP was previously circulated and is available upon request. Photos of the Windswept site before, during, and post-restoration are included at the end of this report. Key sheets of the renderings and construction plans are also attached. Full project plans are available on request.

A compilation of media stories has also been included as a PDF.

#### 5. Certification

**Include this language:** The undersigned verifies that the descriptions of activities and expenditures in this final report are accurate to the best of my knowledge; and that the activities were conducted in agreement with the grant contract. I certify that matching fund levels established in the grant contract and reported here have been met.

Grantee Signature: Karen C Beattie

Name: Karen C. Beattie

Job Title: Vice President of Science & Stewardship

Date: October 8, 2024

Organization: Nantucket Conservation Foundation

## SNEP Watershed Implementation Grants Final Report: Windswept Bog Wetland Restoration NANTUCKET, MA

Messchwerte Department of Fish and Game Division of Ecological Restoration

Invested in Nature and Community

#### **Project Site & Problem Addressed**

Windswept Bog is a former cranberry farm privately owned and managed by Nantucket Conservation Foundation (NCF), a non-profit dedicated to the conservation and stewardship of Nantucket's open lands. Located on the northeast end of Nantucket Island, Windswept Bog includes 40 acres of human-made former cranberry production bogs that are central to a larger assemblage of 231 acres of open space. Prior to restoration, the site was divided into 14 discrete bog cells ranging from 0.7 to 8.4 acres. Each cell was separated by a 2- to 6-foot-high berm with irrigation/drainage ditches and water control structures to manage water levels and direct flows for cranberry production.

The site is typical of retired cranberry bogs and shares many of the stressors common to these former agricultural landscapes. Historic wetlands were converted to farming and legacy impacts include: a sand fill layer placed over native wetland soils; alteration of hydrology via ditching/berms and water control structures; loss of diversity; pesticide/herbicide residues; and nutrient pollution from past fertilizer use. Cumulatively, this results in dry soils in the upper bog platform and a trajectory toward more upland plant species over time. Massachusetts Division of Ecological Restoration (DER) has repeatedly observed that without proactive restoration, abandoned cranberry farms in Massachusetts react to these legacy stressors by moving toward an alternative ecological path: more simplified and less valuable upland plant communities. This indicates a loss of functioning wetlands and the ecosystem services they provide to the coastal watershed.

In terms of its broader landscape context, the site lies within a 19.9 square mile watershed to Nantucket Harbor on the northeast end of the island bordering the Middle Moors-the largest expanse of undeveloped, protected land on-island. Currently, the bogs lie just outside of tidal influence as constricting structures limit tidal influence into the lowest reach of Millbrook Creek; however, even moderate forecasts of sea level rise through the year 2100 predict increasing tidal influence at Polpis Road and into the northwest quadrant of Windswept Bog.

Drainage to Windswept Bog includes ~1,000 acres which flows northwest through the bogs to Polpis and Nantucket Harbors. Surrounding land uses include light residential development and 3,220 acres of protected open space. The site lies upgradient of Millbrook Creek and all surface water flows through the site, ultimately discharging via a culvert under Polpis Road into Millbrook Creek about ¼ mile upstream of Polpis and Nantucket Harbors. The harbor and its surrounds are simultaneously threatened by nutrient and bacteria impairments due to inland activities, namely nutrient loading from runoff from impervious areas and septic systems. TMDL-driven water quality monitoring of Polpis Harbor identified Millbrook Creek, just downstream of the project, as the source of 60-70% of stream discharge N-load to Polpis Harbor. Agriculture has already ceased at the site and use of fertilizers at the bog are not now a concern. Decreased flow velocities post-restoration will allow sediment to settle out and wetlands to perform filtration of nutrients and other pollutants, directly benefiting these receiving waters.

The area around Polpis and Nantucket Harbors on Nantucket Island, MA contains significant salt marshes and eelgrass beds that are and will be vital to the island's climate resilience potential. As sea level rises, these areas are threatened. Loss of these habitats has been identified as one of the main coastal resilience challenges facing this area of the island, and inland salt marsh migration will need to be accommodated to preserve the ecosystem services provided by coastal wetlands (Nantucket Coastal Resilience Plan, 2021).

The overall restoration project will restore 40 acres of former cranberry bog to self-sustaining natural wetlands and integrate the restored wetlands into the broader landscape and watershed. The project has been recognized by the Massachusetts Division of Ecological Restoration (DER) as a DER Priority Project; partners have been coordinating since 2019 to develop and permit the restoration design. SWIG23 funding contributed to implementation of Phase 1 of the restoration, which restored ~14 acres to diverse wetland habitats.

#### **Key Objectives**

There are three high-level goals for the restoration of Windswept Bog: (1) successful ecological restoration, (2) long-term conservation, and (3) continued passive recreational access. To achieve these goals, the project design focuses on restoring hydrology to support self-sustaining wetlands within the site, eliminating barriers to fish and wildlife movement, addressing farm-related physical simplification to dramatically enhance habitat and expand resident (and transient) biota, and providing opportunities for scientific research, public education, and passive recreation.

The project's process-based restoration approach will ultimately repair the natural movement and storage of water as a driver for wetland recovery and re-establishment of self-sustaining wetlands. Work across all phases of the project will remove 3,500ft+ of berms and 28 water control structures to restore wetland hydrology and connectivity and establish a self-sustaining wetland system. Roughening 14 bog cells (6 cells in Phase 2 plus 8 completed in Phase 1) will break up mats of cranberry and underlying sand, expose native peat and seed bank, and create microtopography for diverse wetland habitat. Excavation to lower ground surface elevations will establish a range of habitats (semi-permanently to seasonally flooded wetlands). Collectively, 40 acres of retired cranberry bogs will be restored to wetland habitats, providing flood dampening and improved water quality immediately upstream of Polpis and Nantucket Harbors (which are both impaired for nitrogen and bacteria). The project will preserve refugia for inland species and eventual marsh migration, in turn, reducing exposure to sea level rise and storm damage.

The project will also demonstrate and refine design and construction approaches that can be applied to other retired bogs and resilience projects across the region focused on nature-based strategies for flood protection and adaptation in coastal systems. NCF's ongoing research program at the site will track both short-term and long-term restoration success and facilitate transfer of lessons learned from the project to the broader region.

## PROCESS-BASED RESTORATION

REMOVING BERMS/

# EMBRACING MESSINESS

#### Phase 1 Results

The project was fully designed and permitted by the end of 2023, with bidding and contractor selection completed between October and December 2023. Phase 1 Restoration was completed in January to March 2024 with funding from DER, a grant from the Richard King Mellon Foundation, and this SNEP SWIG award. The initial phase of the project restored 8 bog cells (~14 acres) at the periphery of the site. The project used what is known as a "process-based restoration approach" – which focuses on repairing the natural movement and storage of water as a driver for wetland recovery and ultimate reestablishment of a self-sustaining wetland system. Berms and water control structures—remnants of past agricultural infrastructure—were removed to restore natural wetland hydrology, allowing water to spread out and move more slowly across the site, rather than being channelized into agricultural ditches. Roughening (essentially 'messing up' the surface with an excavator) throughout the bog cells was used to break up mats of cranberry plants and artificially sanded surfaces to expose and engage native peat deposits and seed bed that have been buried for decades and create microtopography for habitat. Deeper excavation in select areas was used to lower ground surfaces and establish pockets of diverse habitats including semipermanently and seasonally flooded wetlands.

#### SPREAD AND SLOW FLOWS...

**REMOVE INFRASTRUCTURE...** 

## TO GENERATE RESTORED WETLAND HABITAT

#### **MONITOR RESPONSE**

#### WATER LEVEL TIMELAPSE IMAGERY SOIL PROFILE DEVELOPMENT WATER QUALITY (NUTRIENTS) FLOW PATTERNS

#### ITERATE/ADAPT for PHASE 2

#### Next Steps

Phase 1 restoration areas were selected because they were representative of different site conditions and provided a good variety of restoration activities to observe postrestoration to gain additional information which has now been incorporated into the design for Phase 2. The Phase 1 pilot was used to confirm restoration response in diverse portions of the site before restoring the remaining bog cells. Phase 2 will then incorporate adaptive management and methodology based on the outcomes of Phase 1 to complete implementation across the entire site.

Construction of Phase 2 is required to complete restoration of the remaining 6 bog cells, creating a continuous, dispersed flow path through the site and connecting the already-restored cells to the natural adjoining wetlands. Phase 2 is also necessary to achieve restoration of the full extent of proposed restoration—the second phase encompasses roughly 2/3 of the total wetland acreage to be restored on the site.

With Phase 1 restoration and post-restoration monitoring now complete, the project is ready for Phase 2. Construction is slated to begin again on November 1, 2024 and continue through March 15, 2025. Phase 2 implementation will restore the remaining 6 bog cells (~26 acres) in the central portion of the site, for a total of approximately 40 acres of restored wetlands across phases. Along with the wetland restoration, upland areas between the bog cells will also be restored and enhanced to facilitate expansion of sandplain grassland habitats and other community types. Phase 2 construction will mirror the work performed in Phase 1, including microtopography, excavation, and construction of boardwalks for public access, resulting in completion of the entirety of the planned restoration project.

Completion of Phase 2 will complete the full extent of the restoration design to achieve the desired ecological and community benefits of the project and set the entirety of the site on a trajectory toward redevelopment of self-sustaining natural wetlands. NCF's Ecological Research, Stewardship and Restoration Department will take over from there, engaging in ongoing monitoring and research after the site is restored to track how vegetation, turtles and other wildlife, and water quality respond to the restoration work over the long-term.

In keeping with MassDER's restoration philosophy, the Windswept Bog Restoration project is built around the concept of process-based restoration. The design intent is to restore natural ecosystem processes and functions so that the system is set on a trajectory to self-sustaining natural recovery, without further ongoing human intervention. Windswept will continue to evolve and adapt over time and has been designed to allow for this adaptation to incorporate future marsh migration under sea level rise. The site is permanently preserved. NCF's Ecological Research, Stewardship and Restoration Department will have a long-term presence on the site conducting monitoring of the restoration and NCF's Land Management staff will maintain the trail network and access amenities that invite the public to explore the site and learn about the restoration project and its benefits.

#### **Engagement & Outreach**

Along the way, NCF conducted extensive outreach using both in-house staff and through hosting a partners' tour and media interviews to provide information on the project to a wider audience. The team was fortunate to have the project featured on the front page of the Boston Globe in March, 2024.

NCF conducts many types of educational programming for the community to increase environmental awareness about Nantucket's natural resources, including ecologistled field trips, lectures, classes, and workshops. NCF's focused several of these in-person public field trips on the Windswept project site, starting before restoration to promote project plans and help the public understand what restoration would entail. These firsthand property and project tours have provided attendees with a chance to learn and ask questions from staff prior to the restoration, and after completion of Phase 1 restoration. These programs will continue through the duration of Phase 2 construction and post-restoration phases for this project to ensure that the public is aware of and engaged with the site and the many benefits arising from restoration.

"It kind of looks like a bomb has gone off," said Jennifer Karberg, director of research and partnerships for the Nantucket Conservation Foundation, which owns the bog. THE BOSTON GLOB

century of farming and restore the land to its native wetland ecosystem. Wetlands reduce the impacts of sea level rise and coastal erosion by acting as a sponge that can absorb flood waters. They can also mitigate climate change by storing carbon dioxide, a greenhouse gas. Both make them a key strategy for the state's battle to adapt to and fight climate change.

The soil at what was once a 231acre organic cranberry bog is being upturned, removed, and jumbled as part of the wetland restoration project supported by a \$1 million grant from the US Fish and Wildlife Service. The total cost of the project will likely be more than \$3 million.

Cranberries, which are native to New England, have a deep history in THURSDAY, MARCH 14, 2024 n

in Nantucket that is becoming wetlands

## BY THE NUMBERS: WINDSWEPT BOGS

14 Acres of Wetland Restored (Phase 1)

Phase 1 Implementation Cost: \$821,535

Value of NCF Staff Time contributed to the project: **\$116,438** 

Projected Total Implementation Cost (all phases): **\$2.9million** 

## WATERSHED HEALTH OUTCOMES/BENEFITS

Process-Based Restoration Approach puts ~40 acres of restored wetlands on a self-sustaining trajectory to recovery

Flows across site slowed and dispersed; reversal of channelization caused by agricultural ditches Decreased sediment transport and nutrient pollution

Improved filtration of sediment and nutrients

Improved habitat for rare species protection; refugia for long-term inland marsh migration Improved resilience and storm surge protection under future climate conditions

Decreased N and P load exiting site and improved water quality in Nantucket and Polpis Harbors

FUSS&O'NEILL

**Photo 1.** *Before restoration* – a retired cranberry bog (Bog 6). Looking east.

Photo 2. After restoration – roughened bog surface (Bog 10), exposing underlying peat deposits. Looking southeast.

**Photo 3.** *Before restoration* – a retired cranberry bog (Bog 1). Looking northwest.

**Photo 4.** *After restoration* – roughened bog surface (Bog 1), exposing underlying peat deposits. Looking southwest.

**Photo 5.** *Before restoration* – a retired cranberry bog (Bog 14). Looking south.

Photo 6. After restoration – roughened bog surface (Bog 14), exposing underlying peat deposits. Looking southeast.

**Photo 7.** *Before restoration* – earthen berm separating between scrub-shrub wetland (right) and retired cranberry bog (left, Bog 4). Looking east.

**Photo 8.** *After restoration* – location of earthen berm that has been removed to connect scrub-shrub wetlands to restored bog (Bog 1). Looking northeast.

Photo 9. Before restoration – external ditch conveying surface water from Bog 13 to Bog 9. Looking west.

**Photo 10.** *After restoration* – external ditch from Bog 13 to Bog 9. Restoration entailed widening the flow path, adding diversity ("islands," multi-thread flow), and terracing upland to repair incision and relax bank slopes.
